## Idea

Memory app is a simple yet powerful tool for keeping your favourite memories in one place.

The map allows you to put small annotations to remind you of dear moments, places and people alike.

A single annotation includes a name, a photo and a form for your thoughts.

## Implementation details

The data are persisted via Apple CoreData framework.

For the map functionality the two tools were used. Apple Map kit for providing the map itself and the simple free map API called *positionstack* for managing the search and navigation.

Data are fetched from API using `JSONDecoder()`. Received coordinates are passed into the map to change the location or to set the annotation in the appropriate place.
